What Is High Blood Pressure Medicine?

Your doctor has prescribed medicine to help lower your blood pressure. You also need to make the other lifestyle changes that will help reduce blood pressure, including: not smoking, reaching and maintaining a healthy weight, lowering sodium (salt) intake, eating a heart-healthy diet including potassium-rich foods, being more regularly physically active, and limiting alcohol to no more than one drink a day (for women) or two drinks a day (for men). Following your overall therapy plan will help you get on the road to a healthier life!

What should I know about taking medicine?

• Your doctor may prescribe one or more drugs to bring your blood pressure down to normal.
• The medicines work in different ways to help lower blood pressure.
• Medicine only works when you take it regularly.
• Don’t ever stop taking medicine on your own.
• Even after your blood pressure is lowered, you may still need to take medicine — perhaps for your lifetime — to keep your blood pressure normal.

What types of medicine may be prescribed?

One or more of these medications are initially used to treat high blood pressure:

• **THIAZIDE DIURETICS** — rid the body of excess sodium (salt) and water and help control blood pressure. These are sometimes called “water pills”.
• **ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS, ANGIOTENSIN II RECEPTOR BLOCKERS (ARBs) and CALCIUM CHANNEL BLOCKERS** — relax and open up the narrowed blood vessels and lower blood pressure.

How can I remember to take it?

Sometimes it’s hard to keep track of your medicine. But to be safe, you must take it properly. Here are some good ways:

• Take your medicine at the same time each day.
• Take medicine along with daily events, like brushing your teeth.
• Use a weekly pill box with separate sections for each day or time of day.
• Ask family and friends to help remind you.
• Use a medicine calendar.
• Set a reminder on your smartphone.

What are their side effects?
For many people, high blood pressure medicine can effectively lower blood pressure, but some types may cause side effects. Tell your doctor if you have side effects, but don’t stop taking your medicine on your own to avoid them. Your healthcare provider can work with you to find the medication or dose that works best for you.

Here are some of the common side effects that may occur:
- Weakness, tiredness or drowsiness
- Erectile dysfunction
- Trouble sleeping
- Slow or fast heartbeat
- Skin rash
- Feeling thirsty
- Cough
- Muscle cramps
- Headache, dizziness or light-headedness
- Constipation or diarrhea
