let's talk about

Risk Factors for Stroke

Knowing your risk factors for stroke is the first step in preventing a stroke. You can change or treat some risk factors, but others you can’t. By having regular medical checkups and knowing your risk, you can focus on what you can change and lower your risk of stroke.

What risk factors can I change or treat?

• **High blood pressure.** This is the single most important risk factor for stroke because it’s the No. 1 cause of stroke. Know your blood pressure and have it checked at least once every two years. Normal blood pressure is below 120/80. If it’s consistently 140/90 or above, it’s too high. Talk to your doctor about how to manage it.

• **Tobacco use.** Tobacco use damages blood vessels. This can lead to blockages within those blood vessels, causing a stroke. Don’t smoke and avoid second-hand smoke.

• **Diabetes.** Having diabetes increases your risk of stroke because it can cause disease of blood vessels in the brain. Work with your doctor to manage diabetes.

• **High cholesterol.** High cholesterol increases the risk of blocked arteries. If an artery leading to the brain becomes blocked, a stroke can result.

• **Physical inactivity and obesity.** Being inactive, obese, or both, can increase your risk of cardiovascular disease.

• **Carotid or other artery disease.** The carotid arteries in your neck supply most of the blood to your brain. A carotid artery damaged by a fatty buildup of plaque inside the artery wall may become blocked by a blood clot. This causes a stroke.

• **Transient ischemic attacks (TIAs).** Recognizing and treating TIAs can reduce the risk of a major stroke. TIAs produce stroke-like symptoms but most have no lasting effects. Know the warning signs of a TIA and seek emergency medical treatment immediately.

• **Atrial fibrillation (AFib) or other heart disease.** In AFib the heart’s upper chambers quiver (like a bowl of gelatin) rather than beating in an organized, rhythmic way. This causes the blood to pool and clot, increasing the risk of stroke. AFib increases risk of stroke five times. People with other types of heart disease have a higher risk of stroke, too.

• **Certain blood disorders.** A high red blood cell count makes clots more likely, raising the risk of stroke. Sickle cell anemia increases stroke risk because the “sickled” cells stick to blood vessel walls and may block arteries.

magazine, a free magazine for
stroke survivors and caregivers at
strokeconnection.org.

Connect with others sharing similar
journeys with stroke by joining our Support
Network at strokeassociation.org/
supportnetwork.

What are the risk factors I can't control?

• Increasing age. Stroke affects people of all ages.
  But the older you are, the greater your stroke risk.

• Gender. In most age groups, more men than women
  have stroke, but more women die from stroke.

• Heredity and race. People whose close blood
  relations have had a stroke have a higher risk of
  stroke. African Americans have a higher risk of
  death and disability from stroke than whites. This is
  because they have high blood pressure more often.
  Hispanic Americans are also at higher risk of stroke.

• Prior stroke. Someone who has had a stroke is at
  higher risk of having another one.

HOW CAN I LEARN MORE?

1 Call 1-888-4-STROKE (1-888-478-7653) to
learn more about stroke or find local support
groups, or visit StrokeAssociation.org.

2 Sign up to get Stroke Connection
magazine, a free magazine for
stroke survivors and caregivers at
strokeconnection.org.
