In all individuals, emphasize a heart-healthy lifestyle across the life course.

In patients with clinical atherosclerotic cardiovascular disease (ASCVD), reduce low-density lipoprotein cholesterol (LDL-C) with high-intensity statin therapy or maximally tolerated statin therapy.

In very high-risk ASCVD, use an LDL-C threshold of 70 mg/dL (1.8 mmol/L) to consider addition of non-statins to statin therapy.

Assess adherence and percentage response to LDL-C-lowering medications and lifestyle changes with repeat lipid measurement 4 to 12 weeks after statin initiation or dose adjustment, repeated every 3 to 12 months as needed.

The 2018 Guideline on the Management of Blood Cholesterol: A Report of the American College of Cardiology/American Heart Association Task Force on Clinical Practice Guidelines has important implications for the treatment of more than 121 million adults in the United States who have some form of cardiovascular disease.

The 2018 AHA/ACC Cholesterol Guideline outlines recommendations for the diagnosis, treatment, and monitoring of adults at very high-risk for future ASCVD events. (See companion pocket guide for Primary Prevention: Treatment of High Blood Cholesterol.)

**Major ASCVD events include:**
- Recent ACS, acute coronary syndrome (within the past 12 months)
- History of MI, myocardial infarction (other than recent ACS event)
- History of ischemic stroke
- Symptomatic peripheral arterial disease (history of claudication with ABI, ankle–brachial index, of <0.85 or previous revascularization or amputation).

**High-risk conditions include:**
- Age ≥65 years
- Heterozygous familial hypercholesterolemia
- History of prior coronary artery bypass surgery or percutaneous coronary intervention outside of the major ASCVD event(s)
- Diabetes mellitus
- Hypertension
- CKD, chronic kidney disease (eGFR 15-59 mL/min/1.73m²)
- Current smoking
- Persistently elevated LDL-C (LDL-C ≥100 mg/dL [≥2.6 mmol/L]) despite maximally tolerated statin therapy and ezetimibe
- History of congestive heart failure

---

Clinical atherosclerotic cardiovascular disease (ASCVD) includes acute coronary syndrome (ACS), those with history of myocardial infarction (MI), stable or unstable angina or coronary or other arterial revascularization, stroke, transient ischemic attack (TIA), or peripheral artery disease (PAD) including aortic aneurysm, all of atherosclerotic origin.

**Cholesterol-reducing lifestyle habits**
- Healthy diet
- Weight loss, if needed
- Aerobic physical activity
- Tobacco cessation, if needed
- Moderation of alcohol consumption

Refer to Table 2 of the 2018 AHA/ACC Cholesterol Guideline for additional Class of Recommendation and Level of Evidence information.
