**Stroke Guidelines for Acute Stroke**

### Clinical Presentation of Stroke

**CINCINNATI PREHOSPITAL STROKE SCALE**

- **Facial Droop:** Normal: Both sides of face move equally/ Abnormal: One side of face does not move at all
- **Arm Drift:** Normal: No downward drift when arms outstretched/ Abnormal: One arm drifts compared to the other
- **Speech:** Normal: Patient uses correct words with no slurring / Abnormal: Slurred or inappropriate words or mute

Interpretation: If any 1 of these 3 signs is abnormal, the probability of a stroke is 72%

"Five Sudden, Severe Symptoms" of stroke include:

- **Sudden** numbness or weakness of the face, arm, or leg
- **Sudden** confusion, difficulty talking or understanding
- **Sudden** vision disturbance
- **Sudden**, severe difficulty walking, dizziness, loss of coordination or balance
- **Sudden**, severe headache

### Initial Evaluation

- Last Known Well (Onset of symptoms is defined as the last time patient documented to be normal before symptoms started; i.e. if awakened with stroke, last known well is considered the time patient went to sleep the night before, etc.)
- Non-Contrast CT of Head
- Vital Signs
- National Institute of Health Stroke Scale (NIHSS) – see appendix A
- Patient Weight
- Finger Stick Glucose
- Labs: CBC & platelet count, PT, PTT, INR, Serum electrolytes, BUN, Creatinine, Troponin

### Transfer Plan

- Have a transfer plan for higher level of stroke care
- Consider treatment plan for stroke patients arriving with a Last Known Well of < 24 hours
- LKW ≤ 4.5 hour, treat with Alteplase (tPA) if eligible and transfer if appropriate
- In patients, treated or untreated with Alteplase, who have persistent significant neurologic deficits and are less than 24 hours following stroke onset, consider immediate transfer to higher level of stroke care
- Hemorrhagic Strokes, prepare for immediate transfer for Neurosurgery services.

********** ALTEPLASE TREATMENT SEE BACK*****
Criteria for IV Alteplase (t-PA) Thrombolytic Treatment

- Age older than 18 years
- Clinical presentation and neurological deficit consistent with acute stroke
- Significant and persistent neurologic deficits
- Onset of symptoms well established and started less than 4.5 hours prior to Alteplase (t-PA) infusion
- Head CT shows no hemorrhage, subdural hematoma, or tumor
- Blood Glucose >50

Alteplase (t-PA) Dosing and Administration

- Order Drug: Intravenous Alteplase (t-PA) for ischemic stroke
- Dose: 0.9mg/kg body weight (Maximum 90mg). Dose will be calculated and verified by two providers
  - Drug will arrive in two vials/bags (one bolus, one infusion)
  - 10% of dose given as a bolus over one minute
  - Remainder of dose infused over 60 minutes
  - After the Alteplase (t-PA) infusion is complete, infuse 50ml of 0.9% normal saline at the same infusion rate as the Alteplase (t-PA) infusion rate in order to infuse the remaining drug in the tubing

Alteplase (t-PA) exclusion Criteria for treatment from 0-4.5 hours from symptom onset:

Clinical Presentation Exclusion Criteria
- Symptoms suggest subarachnoid hemorrhage

Blood Pressure Exclusion Criteria
- Persistent elevated blood pressure (systolic >185mm Hg or diastolic >110 mm Hg) despite treatment *see treatment options

History Exclusion Criteria
- Previous history of intracerebral hemorrhage
- History of GI hemorrhage in the past 3 weeks
- Head trauma in preceding 3 months
- Acute bleeding diathesis (low platelet count <100,000; increased PTT >40 sec; INR >=1.7;
- Use of Factor Xa inhibitors or Thrombin inhibitors, if a dose has been received within 48 hours.

Head CT (non-contrast) Exclusion Criteria
- Evidence of non-ischemic intracranial pathology: tumor, abscess or metastases
- Evidence of intracranial hemorrhage: parenchymal, subarachnoid, subdural, epidural
- Early signs of large cerebral infarction: edema, hypodensity, mass effect

*BP treatment (systolic >185mmHg or diastolic >110 mm Hg)
  - Labetalol 10 to 20 mg IV over 1 to 2 minutes; may be followed by continuous IV infusion 2-8, mg/min;
  - Nicardipine infusion, 5 mg/hour, titrate up by 2.5 mg/hour at 5 to 15 minute intervals, maximum dose 15mg/hour; when desired blood pressure attained, reduce by 3 mg/hour

NOTE: Once BP under control treat with Alteplase (t-PA) and continue to monitor BP
