March's Million Hearts® Collaboration Focus: Improving Heart Health through Healthy Eating

March is here, and Americans are slowly starting to shake off the winter chill and think about spring. Take advantage of their (soon to be) leap forward and talk with them about the steps they can take to improve their heart health. We suggest talking with them about healthy eating this month as its National Nutrition Month and healthy eating helps prevent heart disease and stroke!

Did you know?

- Regularly consuming foods high in sugars, saturated fats, and salt contribute to cardiovascular disease risk factors, like obesity, high blood cholesterol and blood pressure, and diabetes
- A low-saturated fat, high-fiber, high plant food diet can substantially reduce one's risk of developing heart disease
- Only about 1 in every 10 Americans get the daily recommended servings of fruits and vegetables (13 % and 9%, respectively)
- 90% of Americans consume too much sodium, which increases their risk for high blood pressure – a major contributor for heart disease and stroke

Eating healthy, nutrient-rich foods can help patients control risk factors associated with heart disease and stroke and protect them against other conditions that can affect the heart, like diabetes and obesity. As a health provider, you have the power to help Americans improve their eating habits. That's why this March, we are asking you to arm your patients and publics with tools and information to help them make heart healthier food choices!

For Health Professionals: Help Your Patients Make Heart Healthy Eating Choices during National Nutrition Month

As a health professional, you understand the benefits of healthy eating. But, as a human being, you know that it's not always easy to eat well. For people who are just starting to eat healthy, you're aware that it can be even more difficult. There are so many messages about what and how "we should" eat that it can be hard to decipher fact from fiction.

But you can help your patients crack the healthy eating code. How? Don't assume they know what the phrase "healthy eating" means. Share basic facts about nutrition with your patients and ask them if they understand. And give them specific ideas about where to start. If you need help having this important conversation with your patients, check out the resources below:

- [Million Hearts® Healthy Eating & Lifestyle Resource Center](#) – Use this resource to find heart-healthy recipes and easy meal plans. You can walk through the meal plan resource with your patients to layout personalized eating plans and shopping lists based on their current weight and how many pound they should lose each week.
- [American Heart Association Sodium Infographics](#) – Dispel myths about sodium – such as, “My blood pressure is normal, so I don't need to worry about how much sodium I eat,” – and educate adults and children with these graphic, easy-to-understand materials.
- [Sodium and Food Sources](#) – Regardless of whether your patients want or need to lose weight, talk with them about reducing their sodium intake. CDC offers educational materials about salt that you can share and discuss with your patients.
- [ChooseMyPlate.gov](#) – Help your patients understand what their meals should look like. The *USDA Dietary Guidelines for Americans 2015 – 2020* offers information about portion sizes and education for patients, as well as tips and tools for health professionals.

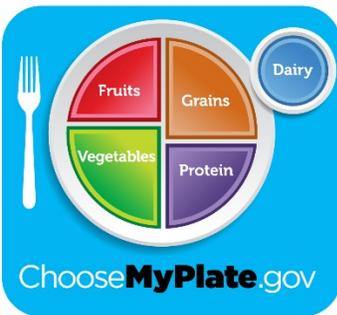

Healthy eating is about more than weight loss, but it's important to understand that healthy eating could be a touchy subject for patients who have struggled with being overweight or obese. Be sure to educate and share resources in a non-judgmental way because improving patients' eating can save their lives.

Talk Healthy Eats with Your Patients for Healthy Hearts this March

As health professionals, we understand that one of the most important ways we can protect our hearts is by eating heart healthy foods. We also know that most people aren't doing it. Only 9% of Americans consume the daily recommended amount of vegetables. Approximately 13% eat enough fruit. And the vast majority of Americans – 90%– consume too much sodium. These poor habits increase Americans' risk for high blood pressure and cholesterol, obesity and diabetes – major risk factors for cardiovascular disease.

Celebrate National Nutrition Month by talking with your patients about the importance of heart healthy eating and the steps they can take to do so. Share facts and resources about healthy food choices and be sure to address their questions. There are a lot of myths about food and healthy eating out in the world. As a health provider, you have the power to help Americans improve their eating habits. So, arm your patients and publics with tools and information to help them make heart healthier food choices this month. And in case you need it, here are some resources that can get the conversation started with your patients:

- [Million Hearts® Healthy Eating & Lifestyle Resource Center](#) – Use this resource to find heart-healthy recipes and easy meal plans. You can walk through the meal plan resource with your patients to layout personalized eating plans and shopping lists based on their current weight and how many pound they should lose each week.

- [American Heart Association Sodium Infographics](#) – Dispel myths about sodium – such as, “My blood pressure is normal, so I don’t need to worry about how much sodium I eat,” – and educate adults and children with these graphic, easy-to-understand materials.
- [Sodium and Food Sources](#) – Regardless of whether your patient wants or needs to lose weight, talk with them about reducing their sodium intake. CDC offers educational materials about salt that you can share and discuss with your patients.
- [ChooseMyPlate.gov](#) – Help your patients understand what their meals should look like. The *USDA Dietary Guidelines for Americans 2015 – 2020*, offers information about portion sizes and education for patients, as well as tips and tools for health care professionals.
