

# **International Perspectives on Stroke Triage, Diagnosis and Treatment**

---

Episode 1: Triage: Optimizing Stroke Patient  
Transport to the Right Center

American  
Stroke  
Association.  
A division of the  
American Heart Association.

# Overview

- Jointly presented by ASA and SVIN
- No CEs available for webinar
- Certificate of Completion is available
- An on-demand recording will be [available on our website](#)

American  
Stroke  
Association.  
A division of the  
American Heart Association.

# Disclosures

- Dr. Robin Novakovic-White: none
- Dr. Peter Panagos: none
- Dr. Ashu Jadhav: none
- Jeanie Luciano: none
- Dr. Natalia Pérez de la Ossa: co-principal investigator of the RACECAT trial, Medtronic
- Dr. Sheila Martins: Research Grant from Ministry of Health/CNPq (National Council for Research) – RESILIENT Trial; Speaker Boehringer Ingelheim, Pfizer, Bayer, Medtronic, Penumbra; International Board of Angels Program

# To Ask a Question

The screenshot shows a webinar interface. The main slide features the American Stroke Association and SVIN logos at the top. The title of the slide is "International Perspectives on Stroke Triage, Diagnosis and Treatment". On the right side, there is a "Questions" sidebar with a close button (X) at the top right. The sidebar contains a green notification box with the text "Webinar staff to everyone" and "The test webinar will begin soon." Below this, there is a text input field with the placeholder text "Ask the staff a question" and a blue "Send" button. A yellow circle highlights the input field and the "Send" button. The sidebar also includes several icons: a blue starburst, a microphone, a hand, a question mark, and a speech bubble. At the bottom of the sidebar, there are icons for "Exit" and "Send".

American Heart Association.

# Role of EMS

- Emergency medical responders are often the first medical professional with direct patient contact.
- Their initial assessment, treatment and decisions on diversion and routing will have significant consequences on a patient's subsequent care, in many ways..... seal their fate and impact their outcome.

# Stroke System of Care

## AHA/ASA Guideline

**Guidelines for the Early Management of Patients With Acute Ischemic Stroke: 2019 Update to the 2018 Guidelines for the Early Management of Acute Ischemic Stroke**  
**A Guideline for Healthcare Professionals From the American Heart Association/American Stroke Association**

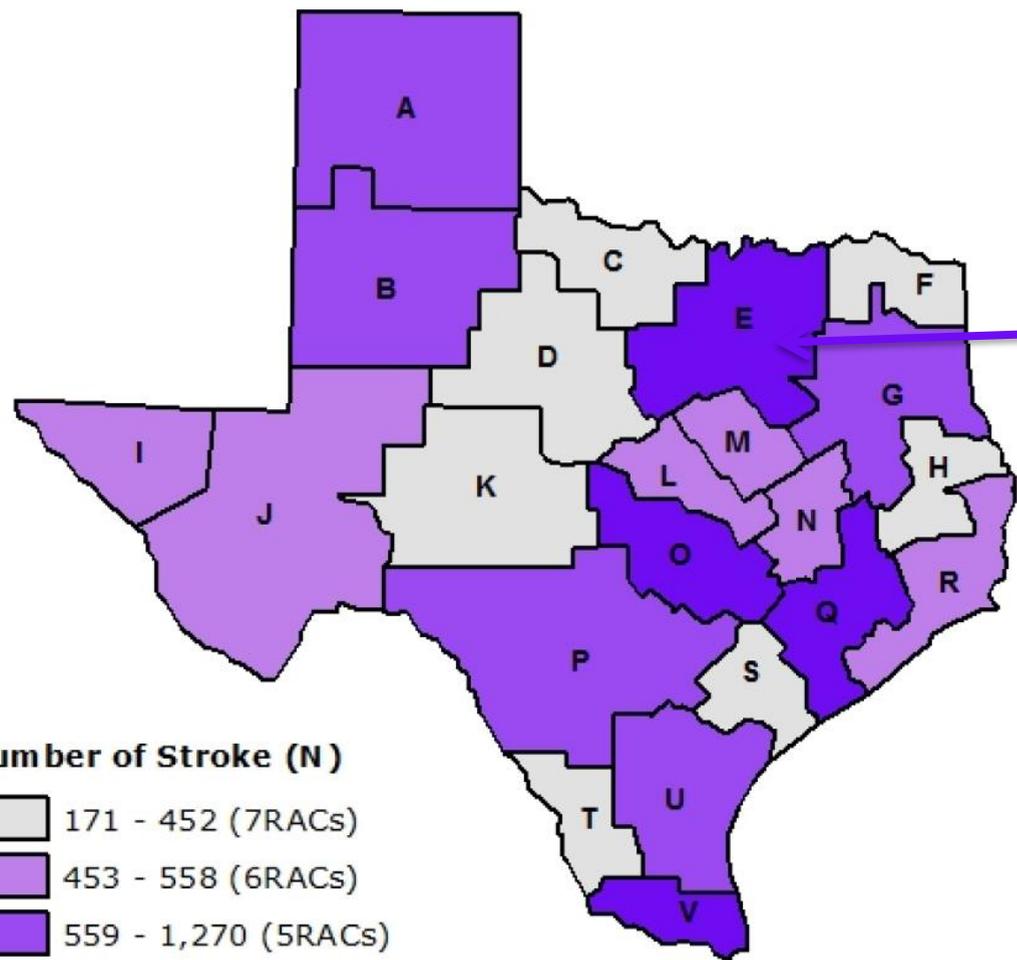

*Endorsed by the Society for Academic Emergency Medicine and The Neurocritical Care Society*  
*Reviewed for evidence-based integrity and endorsed by the American Association of Neurological Surgeons and Congress of Neurological Surgeons.*

- SSOC should be organized to transport patients to the nearest hospital capable of administering stroke treatment.
- A system of care that reduces stroke-related deaths by just 2% to 3% annually would translate into  $\approx 20\,000$  fewer deaths in US.
- Reducing post-stroke disability would also improve quality of life, reduce costs, and reduce the burden on patients, their families, third-party payers and governments.

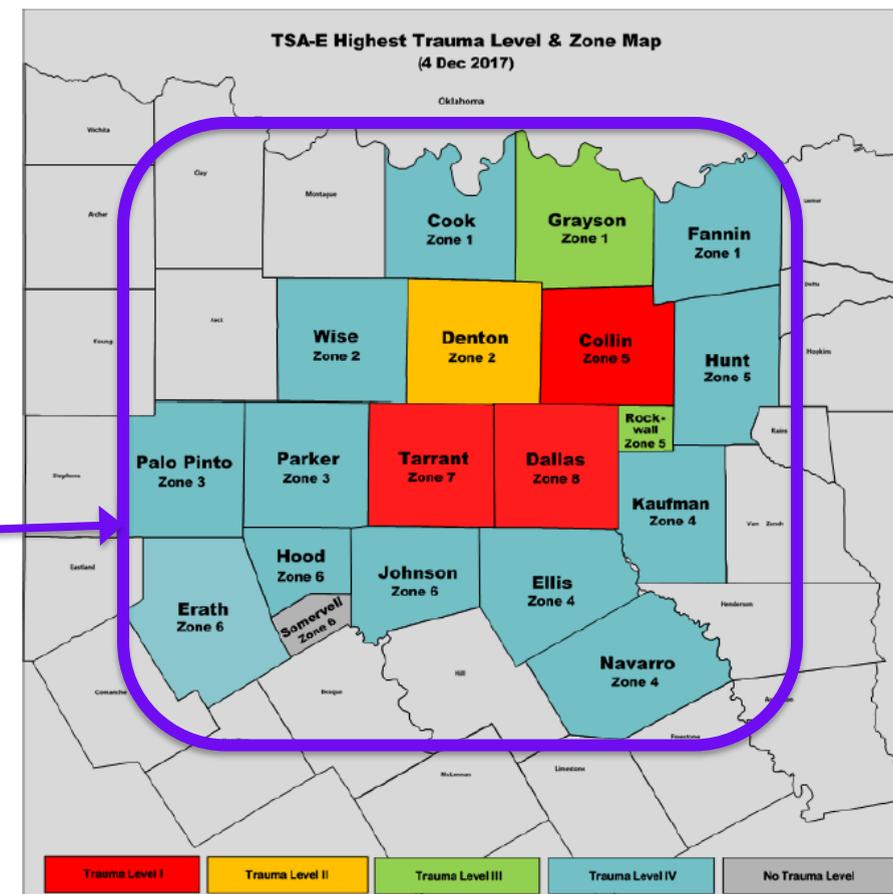

**Total number of strokes reported per Trauma Service Area (TSA)**

**Number of Stroke (N)**

Lightest Purple	171 - 452 (7RACs)
Light Purple	453 - 558 (6RACs)
Medium Purple	559 - 1,270 (5RACs)
Darkest Purple	1,271 - 5,250 (4RACs)

# 44 Stroke Facilities

- 11 CSC
- 27 PSC
- 6 ASRH

American Heart Association.

## 2020 Regional Stroke Plan

Example of our  
Regional Stroke Plan

Endorsed by NCTTRAC Board of Directors

Date: September 10, 2020

Approved by NCTTRAC General Membership

Date: **Pending**

600 Six Flags Drive  
Suite 160  
Arlington, TX 76011  
Phone: 817.608.0390  
Fax: 817.608.0399

[www.NCTTRAC.org](http://www.NCTTRAC.org)

NCTTRAC serves the counties of Cooke, Fannin, Grayson, Denton, Wise, Parker, Palo Pinto, Ellis, Kaufman, Navarro, Collin, Hunt, Rockwall, Erath, Hood, Johnson, Somervell, Tarrant, and Dallas.

### Prehospital Triage of Stroke Patients

#### Basic Level

1. Assess and support ABCs according to UNIVERSAL CARE – ADULT:

- **A (Airway):** Airway support and ventilator assistance are recommended for patients with acute stroke who have decreased consciousness or who have compromised airway. Ensure airway patency with suctioning and OPA or NPA, as needed.
- **B (Breathing):** Supplemental oxygen should be provided to maintain oxygen saturation > 94% (continuous monitoring).
- **C (Circulation):** Evaluate, document and treat signs/symptoms of shock according to the Shock Clinical Practice Guidelines (CPG).
- **D (Disability):** Assess and document GCS, pupillary size and reactivity.
- **E (Exposure/Environmental):** Assess for evidence of traumatic injury, especially head injury.

2. Positioning/stabilization:

- Place the patient in a supine position, head of the bed elevated 30 degrees.
- Cardiac monitoring during transport is recommended. If there is evidence of **shock**, treat according to the **Shock CPG**.
- If there is **hypoglycemia** (POC glucose < 60 mg/dL), treat according to **Diabetic Emergencies CPG**.
- If there is **Seizure** activity, treat according to the **Seizure CPG**.

#### Assessment

##### History

1. Interview patient, family members and other witnesses to determine symptoms, **time of symptom discovery** and **last known well**, or last time patient without symptoms:
  - Obtain mobile number of next of kin and witnesses.
  - NOTE: For “wake up strokes” the time documented is the time last known well not the time the patient was found.
  - NOTE: **Sudden** onset of **any** of the following suggests the possibility of acute stroke:
    - Numbness or weakness of face, arm and/or leg (especially on one side of the body)
    - Confusion
    - Trouble speaking or understanding language
    - Trouble seeing in one or both eyes or double vision
    - Trouble walking
    - Dizziness
    - Loss of balance or coordination
    - Sudden onset of severe headache with no known cause (suggests hemorrhagic stroke)
    - Any asymmetry of the neurological exam
2. Additional History:
  - Obtain patient history including co-morbid conditions.

### AHA/ASA Guideline

#### Guidelines for the Early Management of Patients With Acute Ischemic Stroke: 2019 Update to the 2018 Guidelines for the Early Management of Acute Ischemic Stroke A Guideline for Healthcare Professionals From the American Heart Association/American Stroke Association

*Endorsed by the Society for Academic Emergency Medicine and The Neurocritical Care Society  
Reviewed for evidence-based integrity and endorsed by the American Association of Neurological Surgeons and Congress of Neurological Surgeons.*

### 3. General Supportive Care and Emergency Treatment

#### 3.1. Airway, Breathing, and Oxygenation

3.1. Airway, Breathing, and Oxygenation	COR	LOE	New, Revised, or Unchanged
1. Airway support and ventilatory assistance are recommended for the treatment of patients with acute stroke who have decreased consciousness or who have bulbar dysfunction that causes compromise of the airway.	I	C-EO	Recommendation and COR unchanged from 2013 AIS Guidelines. LOE amended to conform with ACC/AHA 2015 Recommendation Classification System.
2. Supplemental oxygen should be provided to maintain oxygen saturation >94%.	I	C-LD	Recommendation and COR unchanged from 2013 AIS Guidelines. LOE amended to conform with ACC/AHA 2015 Recommendation Classification System.
3. Supplemental oxygen is not recommended in nonhypoxic patients with AIS.	III: No Benefit	B-R	Recommendation unchanged from 2013 AIS Guidelines. COR and LOE amended to conform with ACC/AHA 2015 Recommendation Classification System.
Additional support for this unchanged recommendation from the 2013 AIS Guidelines is provided by an RCT of 8003 participants randomized within 24 hours of admission. There was no benefit on functional outcome at 90 days of oxygen by nasal cannula at 2 L/min (baseline O <sub>2</sub> saturation >93%) or 3 L/min (baseline O <sub>2</sub> saturation ≤93%) continuously for 72 hours or nocturnally for 3 nights. <sup>112</sup>			See Table XXVII in online Data Supplement 1.

#### 3.4. Blood Glucose

3.4. Blood Glucose	COR	LOE	New, Revised, or Unchanged
1. Hypoglycemia (blood glucose <60 mg/dL) should be treated in patients with AIS.	I	C-LD	Recommendation and COR unchanged from 2013 AIS Guidelines. LOE amended to conform with ACC/AHA 2015 Recommendation Classification System.
2. Evidence indicates that persistent in-hospital hyperglycemia during the first 24 hours after AIS is associated with worse outcomes than normoglycemia, and thus, it is reasonable to treat hyperglycemia to achieve blood glucose levels in a range of 140 to 180 mg/dL and to closely monitor to prevent hypoglycemia in patients with AIS.	IIa	C-LD	Recommendation and COR unchanged from 2013 AIS Guidelines. LOE amended to conform with ACC/AHA 2015 Recommendation Classification System.

Powers WJ, Rabinstein AA, Ackerson T. et al. Guidelines for the early management of patients with acute ischemic stroke: 2019 update to the 2018 guidelines for the early management of acute ischemic stroke. Stroke. 2019;50:e344-e418.

# LKW & TSD

## History

- Interview patient, family members and other witnesses to determine symptoms, **time of symptom discovery** and **last known well**, or last time patient without symptoms.
- Obtain mobile number of next of kin and witnesses.

## Prehospital Triage of Stroke Patients

### Basic Level

1. Assess and support ABCs according to UNIVERSAL CARE – ADULT:
  - **A (Airway)**: Airway support and ventilator assistance are recommended for patients with acute stroke who have decreased consciousness or who have compromised airway. Ensure airway patency with suctioning and OPA or NPA, as needed.
  - **B (Breathing)**: Supplemental oxygen should be provided to maintain oxygen saturation > 94% (continuous monitoring).
  - **C (Circulation)**: Evaluate, document and treat signs/symptoms of shock according to the Shock Clinical Practice Guidelines (CPG).
  - **D (Disability)**: Assess and document GCS, pupillary size and reactivity.
  - **E (Exposure/Environmental)**: Assess for evidence of traumatic injury, especially head injury.
2. Positioning/stabilization:
  - Place the patient in a supine position, head of the bed elevated 30 degrees.
  - Cardiac monitoring during transport is recommended. If there is evidence of **shock**, treat according to the **Shock CPG**.
  - If there is **hypoglycemia** (POC glucose < 60 mg/dL), treat according to **Diabetic Emergencies CPG**.
  - If there is **Seizure** activity, treat according to the **Seizure CPG**.

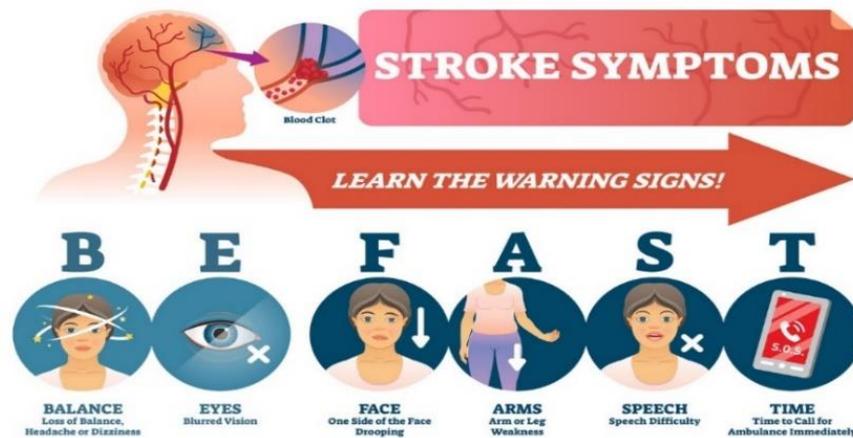

### Assessment

#### History

1. Interview patient, family members and other witnesses to determine symptoms, **time of symptom discovery** and **last known well**, or last time patient without symptoms:
  - Obtain mobile number of next of kin and witnesses.
  - NOTE: For “wake up strokes” the time documented is the time last known well not the time the patient was found.
  - NOTE: **Sudden** onset of **any** of the following suggests the possibility of acute stroke:
    - Numbness or weakness of face, arm and/or leg (especially on one side of the body)
    - Confusion
    - Trouble speaking or understanding language
    - Trouble seeing in one or both eyes or double vision
    - Trouble walking
    - Dizziness
    - Loss of balance or coordination
    - Sudden onset of severe headache with no known cause (suggests hemorrhagic stroke)
    - Any asymmetry of the neurological exam
2. Additional History:
  - Obtain patient history including co-morbid conditions.

# Identify Stroke and Mimics

- Note sudden onset of symptoms that suggest stroke

- Screen for stroke mimics

## Prehospital Triage of Stroke Patients

### Basic Level

1. Assess and support ABCs according to UNIVERSAL CARE – ADULT:

- A (Airway):** Airway support and ventilator assistance are recommended for patients with acute stroke who have decreased consciousness or who have compromised airway. Ensure airway patency with suctioning and OPA or NPA, as needed.
- B (Breathing):** Supplemental oxygen should be provided to maintain oxygen saturation > 94% (continuous monitoring).
- C (Circulation):** Evaluate, document and treat signs/symptoms of shock according to the Shock Clinical Practice Guidelines (CPG).
- D (Disability):** Assess and document GCS, pupillary size and reactivity.
- E (Exposure/Environmental):** Assess for evidence of traumatic injury, especially head injury.

2. Positioning/stabilization:

- Place the patient in a supine position, head of the bed elevated 30 degrees.
- Cardiac monitoring during transport is recommended. If there is evidence of **shock**, treat according to the **Shock CPG**.
- If there is **hypoglycemia** (POC glucose < 60 mg/dL), treat according to **Diabetic Emergencies CPG**.
- If there is **Seizure** activity, treat according to the **Seizure CPG**.

### Assessment

#### History

- Interview patient, family members and other witnesses to determine symptoms, **time of symptom discovery** and **last known well**, or last time patient without symptoms:
  - Obtain mobile number of next of kin and witnesses.
  - NOTE: For "wake up strokes" the time documented is the time last known well not the time the patient was found.

- NOTE: **Sudden onset of any** of the following suggests the possibility of acute stroke:
  - Numbness or weakness of face, arm and/or leg (especially on one side of the body)
  - Confusion
  - Trouble speaking or understanding language
  - Trouble seeing in one or both eyes or double vision
  - Trouble walking
  - Dizziness
  - Loss of balance or coordination
  - Sudden onset of severe headache with no known cause (suggests hemorrhagic stroke)
  - Any asymmetry of the neurological exam

2. Additional History:

- Obtain patient history including co-morbid conditions.

# History

## Additional History:

- Items to Report: Seizure at onset, head trauma, history of recent surgeries, determine pre-existing disability (e.g. nursing home care or unable to walk independently)
- Additional history: PMH, allergies (iodinated contrast)
- Medications – Identify current medications, especially anticoagulants
  - If possible record when last dose was taken

### Assessment

#### History

1. Interview patient, family members and other witnesses to determine symptoms, **time of symptom discovery** and **last known well**, or last time patient without symptoms:
  - Obtain mobile number of next of kin and witnesses.
  - NOTE: For “wake up strokes” the time documented is the time last known well not the time the patient was found.
  - NOTE: **Sudden** onset of **any** of the following suggests the possibility of acute stroke:
    - Numbness or weakness of face, arm and/or leg (especially on one side of the body)
    - Confusion
    - Trouble speaking or understanding language
    - Trouble seeing in one or both eyes or double vision
    - Trouble walking
    - Dizziness
    - Loss of balance or coordination
    - Sudden onset of severe headache with no known cause (suggests hemorrhagic stroke)
    - Any asymmetry of the neurological exam

#### 2. Additional History:

- Obtain patient history including co-morbid conditions.
- Items to Report: seizure at onset, head trauma, history of recent surgeries, history of bleeding problems, signs of possible brain hemorrhage [severe headache of sudden onset, nausea/vomiting with headache or loss of consciousness (LOC)].
- Additional history: Past medical history, allergies (iodinated contrast).
- Be alert to common stroke mimics\*.
- Determine if patient has pre-existing substantial disability (e.g. need for nursing home care or unable to walk independently).
- Medications – obtain a list of all medications including blood thinners such as direct thrombin inhibitors, factor Xa inhibitors, low molecular weight heparin and unfractionated heparin [i.e. warfarin (Coumadin), rivaroxaban (Xarelto), dabigatran (Pradaxa), apixaban (Eliquis), edoxaban (Savaysa), enoxaparin (Lovenox)].
  - If possible, record when last dose was taken.
- Device/implant history (i.e. left ventricular assist device, pacemaker, valve replacement).

#### Examination

- Assess and record blood pressure, rate, rhythm, respiratory rate and oxygen saturation.
- Apply a validated and standardized instrument for stroke screening such as FAST (Face, Arm, Speech, Time), Los Angeles Prehospital Stroke Screen, or Cincinnati Prehospital Stroke Scale
- In prehospital patients who screen positive for suspected stroke, apply a standard prehospital stroke severity assessment tool Cincinnati Stroke Triage Assessment Tool (CSTAT), Field Assessment Stroke Triage for Emergency Destination (FAST-ED), Rapid Arterial Occlusion Evaluation Scale (RACE) or Vision, Aphasia, Neglect (VAN) Assessment.

# Exam

## Examination

- Apply stroke assessment tool: Cincinnati Prehospital Stroke Scale, Los Angeles Prehospital Stroke Screen or FAST (Face, Arm, Speech, Test)

### Assessment

#### History

1. Interview patient, family members and other witnesses to determine symptoms, **time of symptom discovery** and **last known well**, or last time patient without symptoms:
  - Obtain mobile number of next of kin and witnesses.
  - NOTE: For “wake up strokes” the time documented is the time last known well not the time the patient was found.
  - NOTE: **Sudden** onset of **any** of the following suggests the possibility of acute stroke:
    - Numbness or weakness of face, arm and/or leg (especially on one side of the body)
    - Confusion
    - Trouble speaking or understanding language
    - Trouble seeing in one or both eyes or double vision
    - Trouble walking
    - Dizziness
    - Loss of balance or coordination
    - Sudden onset of severe headache with no known cause (suggests hemorrhagic stroke)
    - Any asymmetry of the neurological exam
2. Additional History:
  - Obtain patient history including co-morbid conditions.
  - Items to Report: seizure at onset, head trauma, history of recent surgeries, history of bleeding problems, signs of possible brain hemorrhage [severe headache of sudden onset, nausea/vomiting with headache or loss of consciousness (LOC)].
  - Additional history: Past medical history, allergies (iodinated contrast).
  - Be alert to common stroke mimics\*.
  - Determine if patient has pre-existing substantial disability (e.g. need for nursing home care or unable to walk independently).
  - Medications – obtain a list of all medications including blood thinners such as direct thrombin inhibitors, factor Xa inhibitors, low molecular weight heparin and unfractionated heparin [i.e. warfarin (Coumadin), rivaroxaban (Xarelto), dabigatran (Pradaxa), apixaban (Eliquis), edoxaban (Savaysa), enoxaparin (Lovenox)].
    - If possible, record when last dose was taken.
  - Device/implant history (i.e. left ventricular assist device, pacemaker, valve replacement).

#### Examination

- Assess and record blood pressure, rate, rhythm, respiratory rate and oxygen saturation.
- Apply a validated and standardized instrument for stroke screening such as FAST (Face, Arm, Speech, Time), Los Angeles Prehospital Stroke Screen, or Cincinnati Prehospital Stroke Scale
- In prehospital patients who screen positive for suspected stroke, apply a standard prehospital stroke severity assessment tool Cincinnati Stroke Triage Assessment Tool (CSTAT), Field Assessment Stroke Triage for Emergency Destination (FAST-ED), Rapid Arterial Occlusion Evaluation Scale (RACE) or Vision, Aphasia, Neglect (VAN) Assessment.

**ASA Policy Statement**

**Recommendations for the Establishment of Stroke Systems of Care: A 2019 Update**

**A Policy Statement From the American Stroke Association**

Opeolu Adeoye, MD, MS, FAHA, Chair; Karin V. Nyström, RN, MSN, FAHA; Dileep R. Yavagal, MD; Jean Luciano, CRNP; Raul G. Nogueira, MD; Richard D. Zorowitz, MD; Alexander A. Khalessi, MD, MS, FAHA; Cheryl Bushnell, MD, MHS, FAHA; William G. Barsan, MD; Peter Panagos, MD; Mark J. Alberts, MD, FAHA; A. Colby Tiner, MA; Lee H. Schwamm, MD, FAHA; Edward C. Jauch, MD, MS, FAHA

**Recommendations**

1. Public health leaders along with medical professionals and others should design and implement public education programs focused on stroke systems and the need to seek emergency care (by calling 9-1-1) in a rapid manner. These programs should be repetitive and designed to reach diverse populations. Further research is needed to establish the most effective programs for diverse populations. (New)
2. EMS leaders, in coordination with local, regional, and state agencies and in consultation with medical authorities and local experts, should develop triage paradigms and protocols that ensure that all patients with a known or suspected stroke are rapidly identified and assessed with a validated and standardized instrument for stroke screening such as FAST (Face, Arm, Speech, Time), Los Angeles Prehospital Stroke Screen, or CPSS. (Revised)
  - a. In prehospital patients who screen positive for suspected stroke, a standard prehospital stroke severity assessment tool (eg, Cincinnati Stroke Triage Assessment Tool, Rapid Arterial Occlusion Evaluation, Los Angeles Motor Scale, and Field Assessment Stroke Triage for Emergency Destination) should be used to facilitate triage. In the absence of new data, it is reasonable to adapt the Mission: Lifeline algorithm to the needs of the community. Further research is needed to establish the most effective prehospital stroke severity triage scale, which may be one of the published scales or a novel scale or device. (New)
  - b. Standardized approaches to prehospital stroke assessment, triage, and management should be encouraged for 9-1-1 call centers and EMS dispatchers. Further research is needed to establish the most effective programs for stroke recognition by 9-1-1 call centers and EMS dispatchers. (New)
3. When there are several intravenous alteplase-capable hospitals in a well-defined geographic region, extra transportation times to reach a facility capable of endovascular thrombectomy should be limited to no more than 15 minutes in patients with a prehospital stroke severity scale score suggestive of LVO. When several hospital options exist within similar travel times, EMS should seek care at the facility capable of offering the highest level of stroke care. Further research is needed to establish travel time parameters for hospital bypass in cases of prehospital suspicion of LVO. (New)
  - a. Protocols that include prearrival notification by EMS that a stroke patient is en route should be used in all cases. (New)

**AHA/ASA Guideline**

**Guidelines for the Early Management of Patients With Acute Ischemic Stroke: 2019 Update to the 2018 Guidelines for the Early Management of Acute Ischemic Stroke**  
**A Guideline for Healthcare Professionals From the American Heart Association/American Stroke Association**

*Endorsed by the Society for Academic Emergency Medicine and The Neurocritical Care Society*  
*Reviewed for evidence-based integrity and endorsed by the American Association of Neurological Surgeons and Congress of Neurological Surgeons.*

**1.3. EMS Systems**

1.3. EMS Systems	COR	LOE	New, Revised, or Unchanged
<b>1. Regional systems of stroke care should be developed. These should consist of the following: (a) healthcare facilities that provide initial emergency care, including administration of IV alteplase, and (b) centers capable of performing endovascular stroke treatment with comprehensive periprocedural care to which rapid transport can be arranged when appropriate.</b>	I	A	Recommendation reworded for clarity from 2015 Endovascular. COR and LOE unchanged. See Table XCV in online Data Supplement 1 for original wording.
<b>2. EMS leaders, in coordination with local, regional, and state agencies and in consultation with medical authorities and local experts, should develop triage paradigms and protocols to ensure that patients with a known or suspected stroke are rapidly identified and assessed by use of a validated and standardized tool for stroke screening.</b>	I	B-NR	Recommendation reworded for clarity from 2013 Stroke Systems of Care. COR and LOE added to conform with ACC/AHA 2015 Recommendation Classification System. See Table XCV in online Data Supplement 1 for original wording.
<b>Multiple stroke screening tools have been developed for prehospital evaluation of suspected stroke. A 2016 systematic review assessed the performance of 7 tools.<sup>26</sup> Those with the highest number of subjects in whom the tool had been applied included Cincinnati Prehospital Stroke Scale (CPSS),<sup>27</sup> Los Angeles Prehospital Stroke Screen (LAPSS),<sup>28</sup> Recognition of Stroke in the Emergency Room (ROSIER),<sup>29</sup> and FAST (Face, Arm, Speech, Time).<sup>30</sup> CPSS and FAST performed similarly with regard to sensitivity (range, 44%–95% for CPSS, 79%–97% for FAST) but both had poor specificity (range, 24%–79% for CPSS, 13%–88% for FAST). More complex tools such as LAPSS had improved specificity (range, 48%–97%) but at the cost of sensitivity (range, 59%–91%). All tools inadequately accounted for false-negative cases, thereby likely artificially boosting performance. The review concluded that no strong recommendation could be made for use of one tool over another.</b>			See Tables III and IV in online Data Supplement 1.

Dileep R. Yavagal, MD; Jean Luciano, CRNP; Raul G. Nogueira, MD;  
Richard D. Zorowitz, MD; Alexander A. Khalessi, MD, MS, FAHA;  
Cheryl Bushnell, MD, MHS, FAHA; William G. Barsan, MD; Peter Panagos, MD;  
Mark J. Alberts, MD, FAHA; A. Colby Tiner, MA; Lee H. Schwamm, MD, FAHA;  
Edward C. Jauch, MD, MS, FAHA

If the stroke assessment tool is positive apply a stroke severity scale:

- Cincinnati Stroke Triage Assessment Tool (CSTAT)
- Field Assessment Stroke Triage for Emergency Destination (FAST-ED)
- Rapid Arterial Occlusion Evaluation Scale (RACE)
- Vision, Aphasia, Neglect (VAN)

#### Recommendations

1. Public health leaders along with medical professionals and others should design and implement public education programs focused on stroke systems and the need to seek emergency care (by calling 9-1-1) in a rapid manner. These programs should be repetitive and designed to reach diverse populations. Further research is needed to establish the most effective programs for diverse populations. (New)
2. EMS leaders, in coordination with local, regional, and state agencies and in consultation with medical authorities and local experts, should develop triage paradigms and protocols that ensure that all patients with a known or suspected stroke are rapidly identified and assessed with a validated and standardized instrument for stroke screening such as FAST (Face, Arm, Speech, Time), Los Angeles Prehospital Stroke Screen, or CPSS. (Revised)
  - a. In prehospital patients who screen positive for suspected stroke, a standard prehospital stroke severity assessment tool (eg, Cincinnati Stroke Triage Assessment Tool, Rapid Arterial Occlusion Evaluation, Los Angeles Motor Scale, and Field Assessment Stroke Triage for Emergency Destination) should be used to facilitate triage. In the absence of new data, it is reasonable to adapt the Mission: Lifeline algorithm to the needs of the community. Further research is needed to establish the most effective prehospital stroke severity triage scale, which may be one of the published scales or a novel scale or device. (New)
  - b. Standardized approaches to prehospital stroke assessment, triage, and management should be encouraged for 9-1-1 call centers and EMS dispatchers. Further research is needed to establish the most effective programs for stroke recognition by 9-1-1 call centers and EMS dispatchers. (New)
3. When there are several intravenous alteplase-capable hospitals in a well-defined geographic region, extra transportation times to reach a facility capable of endovascular thrombectomy should be limited to no more than 15 minutes in patients with a prehospital stroke severity scale score suggestive of LVO. When several hospital options exist within similar travel times, EMS should seek care at the facility capable of offering the highest level of stroke care. Further research is needed to establish travel time parameters for hospital bypass in cases of prehospital suspicion of LVO. (New)
  - a. Protocols that include prearrival notification by EMS that a stroke patient is en route should be used in all cases. (New)

# Management

- EMS personnel should begin the initial management of stroke in the field.
- Prevent aspiration, HOB > 30. Ensure airway patency with suctioning and OPA or NPA, as needed.
- Provide supplemental oxygen if needed to keep oxygen saturation > 94%.
- Treatment of hypertension is NOT recommended unless blood pressure > 220/120 mmHg.
- Treat hypotension. Evaluate, document and treat signs/symptoms of shock according to the Shock CPG.
- If possible obtain EKG during workup, as long as it does not delay transportation to appropriate hospital.

## Management

- EMS personnel should begin the initial management of stroke in the field as outlined in this document.
- Prevent aspiration, HOB > 30. Ensure airway patency with suctioning and OPA or NPA, as needed.
- Provide supplemental oxygen if needed to keep oxygen saturation > 94%
- Treatment of hypertension is NOT recommended unless blood pressure  $\geq$  220/120 mmHg.
- Treat hypotension. Evaluate, document and treat signs/symptoms of shock according to the Shock CPG. If possible, obtain EKG during workup, as long as it does not delay transport to appropriate stroke facility.
- Avoid dextrose containing fluids in non-hypoglycemic patients.
- Perform and document a POC Glucose analysis and treat according to the ASA 2019 Guidelines for Management of Acute Ischemic Stroke.
  - Hypoglycemia (blood glucose < 60 mg/dL) should be treated in patients suspected of acute ischemic stroke.
- To facilitate expedited stroke workup in the ED, place at least one 18 or 20 gauge IV in the antecubital fossa or forearm (right preferable).
- To facilitate fastest Door-to-Needle and stroke care, if possible collect blood sample to provide receiving facility, however, as long as it does not delay transfer.

## System Triage

- Goal for on scene time, 10-15 minutes or less. Encourage family to go directly to the ED if not transported with the patient.
- See appendix A for the Acute Stroke Triage and Transport Algorithm.
- Call stroke alert, pre-notify receiving facility that a suspected stroke patient is in route so that the appropriate resources may be mobilized before patient arrival.
  - Goal to provide: LKW, stroke severity score, next of kin phone number
- Goal: 30 seconds for EMS to ED triage nurse hand-off.
- Bypass Exclusions:
  - If severe or life-threatening trauma is suspected in addition to stroke, transfer to the appropriate level trauma center.
  - Patients under hospice care or with Medical Orders for Scope of Treatment (MOST) that outlines no emergency measures should go to the nearest appropriate hospital.

*\*Common ischemic stroke mimics: alcoholic intoxication, cerebral infections, drug overdose, hemorrhagic stroke, hypoglycemia, hyperglycemia, metabolic disorders, atypical migraines, neuropathies (e.g. Bell's palsy), seizure, post-ictal state and tumors.*

## X. Pediatric Stroke Triage and Management

# Management

- Avoid dextrose containing fluids in non-hypoglycemic patients.
- Perform and document a POC Glucose, treat according to the ASA 2019 Guidelines for Management of Acute Ischemic Stroke.
- Hypoglycemia (blood glucose < 60 mg/dL) should be treated in patients suspected of acute ischemic stroke.
- To facilitate expedited stroke workup in the ED, place at least one 18 or 20 gauge IV in the antecubital fossa or forearm (right preferable).
- To facilitate fastest Door-to-Needle and stroke care, if possible collect blood sample to provide receiving facility.

# EMERGENCY MEDICAL SERVICES ACUTE STROKE ROUTING

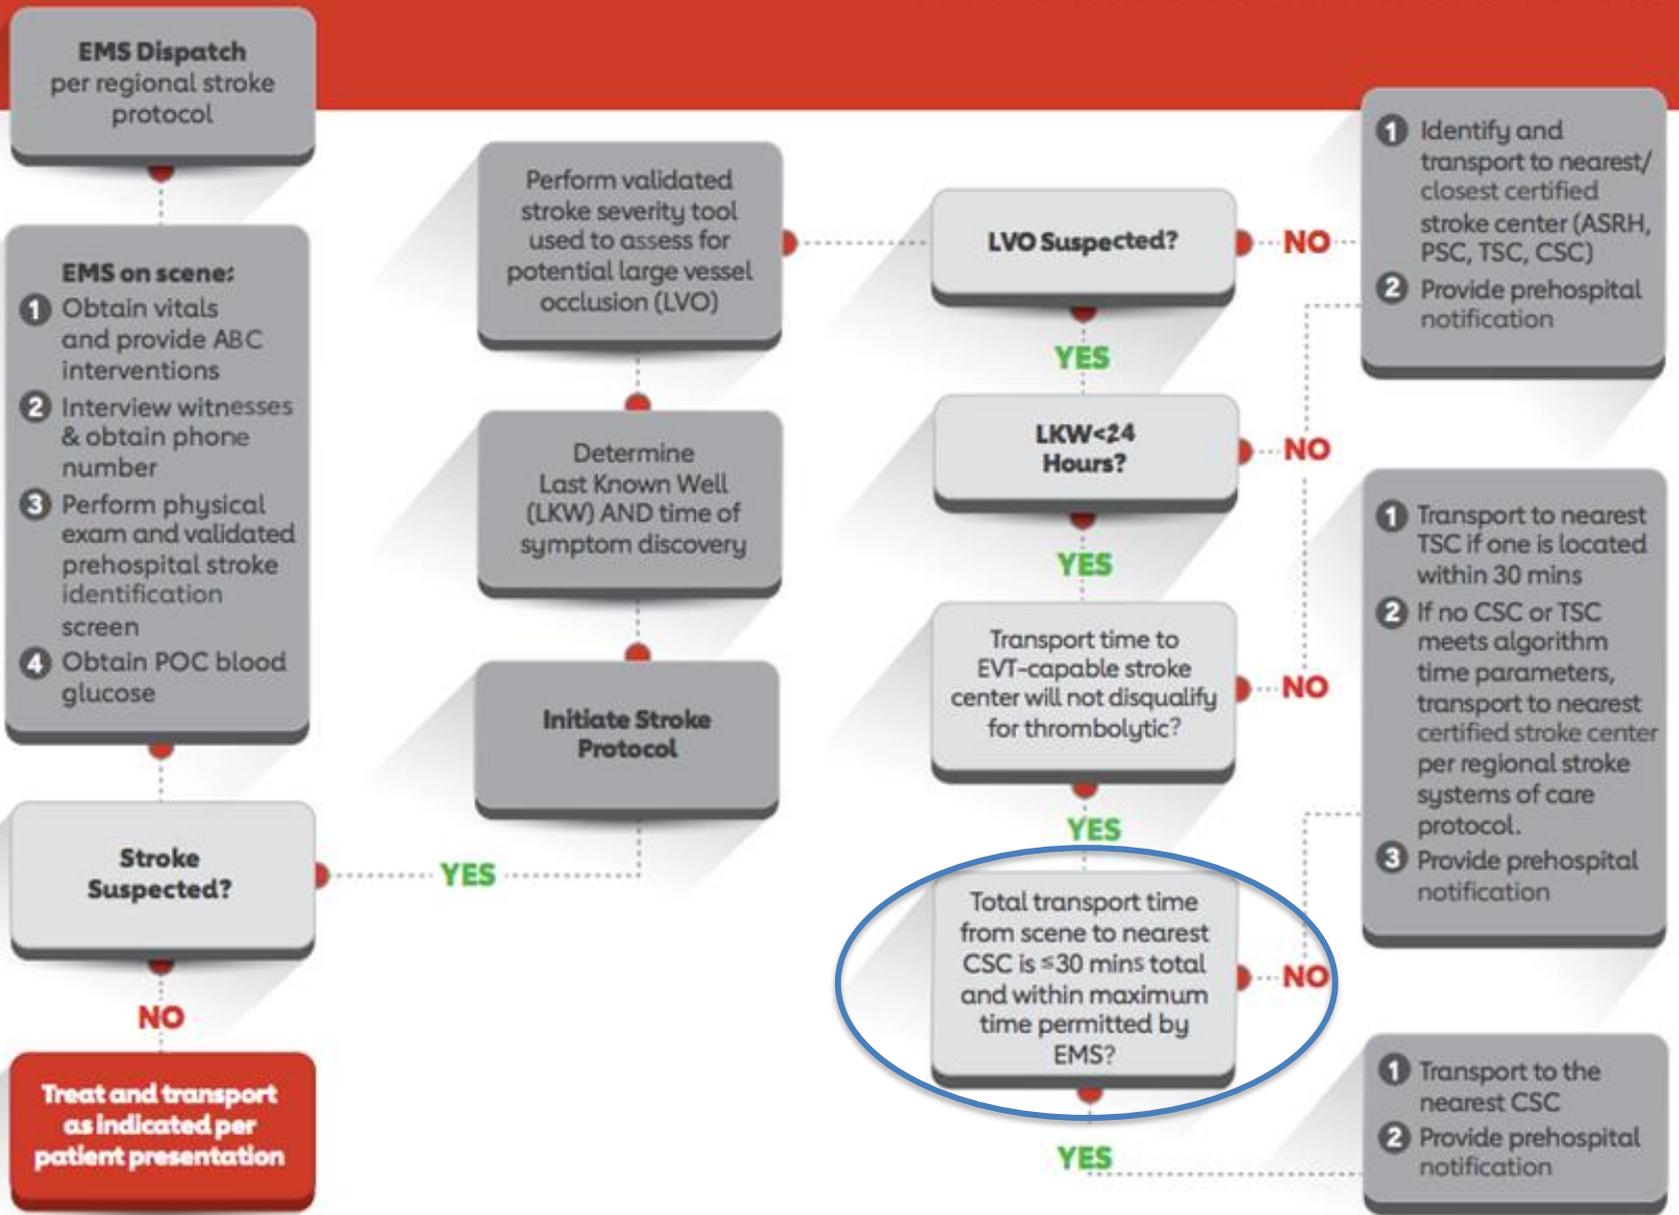

# EMERGENCY MEDICAL SERVICES ACUTE STROKE ROUTING

# EMERGENCY MEDICAL SERVICES ACUTE STROKE ROUTING

# NCTTRAC recommend inter-facility stroke terminology to convey level of stroke emergency:

- **Level 1 Stroke** = Patient with an ischemic or hemorrhagic stroke in need of an emergent intervention
- **Level 2 Stroke** = Patient with an ischemic or hemorrhagic stroke in need of an urgent transfer for higher level of care but without emergent need of an intervention
- **Level 3 Stroke** = Patient with an ischemic or hemorrhagic stroke in need of transfer but without emergent or urgent needs
  
- **Level 1 and 2 Stroke** - time from *agency notification* to transportation *arrival at the transferring hospital*  $\leq$  30 minutes. Consider option of lights and sirens
- **Level 1 Stroke** - if ground transportation will take  $>$  30 minutes to reach the receiving facility consider air transport

# NCTTRAC Quality Project Prehospital Reports – 2020 YTD

## Stroke Severity Screen Performed and Reported - Rate Based

Percentage of confirmed stroke patients transported to your hospital by EMS and for whom a validated regional or national severity screen tool was used with documentation of the outcome.

Stroke Severity Screen Performed and Reported - Rate Based				
Benchmark Group	Time Period	Numerator	Denominator	% of Patients
All TX Hospitals	2020	536	4910	10.9%
NCTTRAC Stroke Committee	2020	32	841	3.8%

## Documentation of Time LKW

Documentation of Time Last Known Well or Time of Discovery of Stroke Symptoms: Percentage of confirmed stroke patients transported to your hospital by EMS and for whom a time "Last Known Well" (LKW) of Stroke Symptoms was documented.

Documentation of Time LKW				
Benchmark Group	Time Period	Numerator	Denominator	% of Patients
All TX Hospitals	2020	1827	4148	44.0%
NCTTRAC Stroke Committee	2020	170	739	23.0%

## On-Scene Time <= 15 Minutes for Suspected Stroke

Distribution of times for suspected stroke patients transported to your hospital by EMS. Based on AHA Guidelines, the goal for EMS on-scene time is <= 15 minutes.

On-Scene Times <=15 minutes for Suspected Stroke				
Benchmark Group	Time Period	Numerator	Denominator	% of Patients
All TX Hospitals	2020	1043	2073	50.3%
NCTTRAC Stroke Committee	2020	88	209	42.1%

Mark J. Alberts, MD, FAHA; A. Colby Tiner, MA; Lee H. Schwamm, MD, FAHA;  
Edward C. Jauch, MD, MS, FAHA

**Abstract**—In 2005, the American Stroke Association published recommendations for the establishment of stroke systems of care and in 2013 expanded on them with a statement on interactions within stroke systems of care. The aim of this policy statement is to provide a comprehensive review of the scientific evidence evaluating stroke systems of care to date and to update the American Stroke Association recommendations on the basis of improvements in stroke systems of care. Over the past decade, stroke systems of care have seen vast improvements in endovascular therapy, neurocritical care, and stroke center certification, in addition to the advent of innovations, such as telestroke and mobile stroke units, in the context of significant changes in the organization of healthcare policy in the United States. This statement provides an update to prior publications to help guide policymakers and public healthcare agencies in continually updating their stroke systems of care in light of these changes. This statement and its recommendations span primordial and primary prevention, acute stroke recognition and activation of emergency medical services, triage to appropriate facilities, designation of and treatment at stroke centers, secondary prevention at hospital discharge, and rehabilitation and recovery. (*Stroke*. 2019;50:00-00. DOI: 10.1161/STR.000000000000173.)

**Background and Purpose**—The purpose of these guidelines is to provide an up-to-date comprehensive set of recommendations in a single document for clinicians caring for adult patients with acute arterial ischemic stroke. The intended audiences are prehospital care providers, physicians, allied health professionals, and hospital administrators. These guidelines supersede the 2013 Acute Ischemic Stroke (AIS) Guidelines and are an update of the 2018 AIS Guidelines.

**Methods**—Members of the writing group were appointed by the American Heart Association (AHA) Stroke Council's Scientific Statements Oversight Committee, representing various areas of medical expertise. Members were not allowed to participate in discussions or to vote on topics relevant to their relations with industry. An update of the 2013 AIS Guidelines was originally published in January 2018. This guideline was approved by the AHA Science Advisory and Coordinating Committee and the AHA Executive Committee. In April 2018, a revision to these guidelines, deleting some recommendations, was published online by the AHA. The writing group was asked to review the original document and revise if appropriate. In June 2018, the writing group submitted a document with minor changes and with inclusion of important newly published randomized controlled trials with >100 participants and clinical outcomes at least 90 days after AIS. The document was sent to 14 peer reviewers. The writing group evaluated the peer reviewers' comments and revised

The American Heart Association makes every effort to avoid any actual or potential conflicts of interest that may arise as a result of an outside relationship or a personal, professional, or business interest of a member of the writing panel. Specifically, all members of the writing group are required to complete and submit a Disclosure Questionnaire showing all such relationships that might be perceived as real or potential conflicts of interest.

This statement was approved by the American Heart Association Science Advisory and Coordinating Committee on September 12, 2019, and the American Heart Association Executive Committee on October 3, 2019. Destination scale

Developed to predict LVO (mostly anterior circulation strokes)

# LAMS (LA motor scale)

- Predictive LVAO 4-5 = near 100% LVO
- LAMS  $\geq 4$  was 7x positive likelihood LVO and
- 0.81 sensitivity, 0.89 specificity, 0.85 accuracy

**LAMS**

**LOS ANGELES MOTOR SCALE**

**PATIENT REPORT TO ED – KEY ITEMS<sup>1</sup>**

- Patients' age, sex, weight
- Mechanism of injury or medical problem
- Chief complaint with brief history of present illness
- Associated symptoms
- Past medical history
- Vital signs
- Level of consciousness
- General appearance, distress, cardiac rhythm
- Interventions by EMS (IV, medication administration)
- ETA (the more critical the patient, the earlier you need to notify the receiving facility)

Always follow your state, local or EMS agency/medical directors' protocols.

EMS LAMS Stroke Scale - The Los Angeles Motor Scale*		LAMS Score
<b>FACIAL DROOP</b>	ABSENT PRESENT	0 1
<b>ARM DRIFT</b>	ABSENT DRIFTS DOWN FALL RAPIDLY	0 1 2
<b>GRIP STRENGTH</b>	NORMAL WEAK GRIP NO GRIP	0 1 2
<b>LAMS SCALE TOTAL:</b>		

\* Chart adapted from Nazliel B, Starkman S, Liebskind DS, et al. A brief prehospital stroke severity scale identifies ischemic stroke patients harboring proximal large arterial occlusions. Stroke 2008;39:2264-7.

**ADDITIONAL INFORMATION**

**PRE-HOSPITAL MANAGEMENT OF AN ACUTE STROKE<sup>2</sup>**

- Assess the airway, breathing and circulatory status
- Check blood glucose
- Obtain full set of vital signs
- Review patient medications
- Perform 12 lead ECG
- Establish IV access

**ACUTE ISCHEMIC STROKE – IV t-PA CONTRAINDICATIONS<sup>3</sup>**

- Active internal bleeding
- Recent intracranial or intraspinal surgery or serious head trauma
- Intracranial conditions that may increase the risk of bleeding
- Bleeding diathesis
- Current severe uncontrolled hypertension
- Current intracranial hemorrhage
- Subarachnoid hemorrhage
- History of recent stroke

# LAG Score

- 3 item stroke severity scale (Frankfurt)
- **L** = LOC (arouse without painful stimuli)
- **A** = Arm Strength (Lift arm off stretcher)
- **G** = Gaze (Do eyes cross ML to V/V stimuli)
  - 2 – No (not present)
  - 1 – In between
  - 0 – Yes (present)
- Sum = 5-6 then 100% LAO or proximal clot
- Score  $\geq 4$  as accurate as NIHSS  $\geq 14$  (0.93)

# RACE Scale

- **R**apid **A**rterial **O**Cclusion **E**valuation
- Based off NIHSS
- Prospectively validated in field (357 cases)
- Scale-Face/Arm/Leg/Gaze/Speech/Agnosia
  - Correlation with NIHSS ( $r=0.76$ ;  $P<0.001$ )
  - LVO 76 of 357 cases (21%)
  - ROC RACE vs. NIHSS (0.82 and 0.85 respectively)
  - RACE  $\geq 5$  sens 85%, spec 68%, PPV 0.42, NNP 0.94

# **Cincinnati Stroke Triage Assessment Tool (C-STAT)**

## **Formally known as CPSSS**

- Derived from NINDS and IMS III Cohorts
- Score range 0-4
- Components: Conjugate gaze (NIHSS $\geq$ 1), LOC & questions (NIHSS  $\geq$  1), arm weakness (NIHSS  $\geq$  2)
- AUC 0.89, score  $\geq$  2 was 89% sensitive and 73% specific identifying NIHSS  $\geq$  15
- For 222/303 IMS III patients w/ LVO, C-STAT AUC 0.67, score  $\geq$ 2 83% sens, 40% spec in predicting LVO

# Field Assessment Stroke Triage to Determine Emergency Destination

- **FAST-ED** (field assessment stroke triage for emergency destination) based off NIHSS items with high LVO PV
  - Score Points: Face, Arm, Speech, Time, Eyes, Denial/Neglect
- Tested in Screening and Outcomes Project in Stroke (**STOPStroke**) cohort
- LVO defined by total occlusion carotid, M1, M2 or basilar
- 727 qualifying patients and 240 LVO detected (33%)
- Compared well with NIHSS and more accurate RACE/CPSS

	Sensitivity	Specificity	PPV	NPP
• FAST-ED $\geq$ 4	60%	89%	72%	82%
• RACE $\geq$ 5	55%	87%	68%	79%
• C-STAT $\geq$ 2	56%	85%	65%	78%

- Simple scale, needs field validation

# Stroke Severity Scales: No Clear Winner Yet

**Table 3. Accuracy of the 3ISS, LAMS, RACE, and CPSSS in Comparison With PASS in Prediction of Large Artery Occlusion in the Entire Study Population**

	AUC*	CP	Sensitivity	Specificity	AUC†	Odds Ratio	PPV	NPV	LR+	LR-
3ISS (95% CI)	0.74	≥3	0.50 (0.47–0.53)	0.92 (0.91–0.93)	0.71 (0.70–0.73)	11.50 (9.43–14.00)	0.77 (0.74–0.80)	0.77 (0.76–0.79)	6.21 (5.30–7.28)	0.54 (0.51–0.58)
LAMS (95% CI)	0.74	≥4	0.57 (0.54–0.60)	0.84 (0.82–0.85)	0.70 (0.69–0.72)	6.82 (5.77–8.06)	0.66 (0.63–0.69)	0.78 (0.76–0.80)	3.50 (3.13–3.92)	0.51 (0.48–0.55)
RACE (95% CI)	0.78	≥5	0.59 (0.56–0.62)	0.86 (0.84–0.87)	0.72 (0.71–0.74)	8.73 (7.34–10.40)	0.70 (0.66–0.72)	0.79 (0.78–0.81)	4.17 (3.71–4.69)	0.48 (0.44–0.51)
CPSSS (95% CI)	0.76	≥2	0.59 (0.56–0.62)	0.86 (0.84–0.87)	0.72 (0.71–0.74)	8.49 (7.14–10.10)	0.69 (0.66–0.72)	0.79 (0.77–0.81)	4.09 (3.63–4.60)	0.48 (0.45–0.52)
PASS (95% CI)	0.75	≥2	0.64 (0.61–0.67)	0.83 (0.81–0.85)	0.74 (0.72–0.75)	8.66 (7.31–10.30)	0.67 (0.64–0.70)	0.81 (0.79–0.83)	3.76 (3.38–4.18)	0.43 (0.40–0.47)

95% CI indicates 95% confidence interval; 3ISS, 3-Item Stroke Scale; AUC, area under the curve; CP, cut point (optimal); CPSSS, Cincinnati Prehospital Stroke Severity Scale; LAMS, Los Angeles Motor Scale; NPV, negative predictive value; PPV, positive predictive value; RACE, Rapid Arterial Occlusion Evaluation; and PASS, Prehospital Assessment Stroke Triage for Emergency Destination.

- RACE scale in Catalonia

### Search

The RACE scale is a prehospital simple and rapid neurological scale to detect acute stroke patients with a high probability of having a large vessel occlusion, candidates to be treated with endovascular techniques in a comprehensive stroke center.

The RACE scale is a simplification of the NIHSS scale using those items with a higher ability to predict the presence of a large vessel occlusion. The RACE scale evaluates 5 items: facial palsy, brachial paresis, crural paresis, oculocephalic deviation and aphasia/agnosia, with a total score of 0-9.

A score  $\geq 5$  indicates the possibility of a large vessel occlusion with a sensitivity of 85% and specificity of 69%.

# I Latin American Stroke Ministerial Meeting

## August 2018

**Declaración de Gramado**  
**Compromiso para enfrentar el Accidente Vascular Cerebral en América Latina**  
Gramado, 02 de agosto de 2018

Nosotros, los ministros y representantes de los países, reunidos en Gramado, Brasil, el día 02 de agosto de 2018 para el I Encuentro Ministerial Latinoamericano de Accidente Cerebrovascular;

Reconociendo que las enfermedades cerebrovasculares, incluyendo el Accidente Cerebrovascular (ACV), está entre las principales causas de muerte en la población de América Latina, y que el ACV es prevenible y tratable por medio de estrategias basadas en evidencias y costo-efectivas;

Destacando que la cooperación entre los países Latinoamericanos para el enfrentamiento al ACV se inserta en el marco de la implementación de los Objetivos de Desarrollo Sostenible de la agenda 2030 de las Naciones Unidas, que propone colaboración para reducir, hasta 2030, la mortalidad precoz por enfermedades no transmisibles a través de la prevención y tratamiento, y promover la salud mental y bienestar;

Recordando el Plan de Acción Global para la Prevención y Control de las Enfermedades No Transmisibles 2013-2020, de la Organización Mundial de la Salud, que tiene por objetivo reducir en 25% la mortalidad precoz por enfermedades crónicas no transmisibles hasta el 2025;

Determinados a unir nuestros esfuerzos para promover el desarrollo y la implementación de políticas públicas efectivas, integradas, sostenibles y basadas en evidencias para la prevención y el tratamiento del ACV y de sus factores de riesgo en América Latina, decidimos:

1. Proporcionar educación a la población acerca de las señales de alarma del ACV, urgencia del tratamiento y control de los factores de riesgo.
2. Promover ambientes seguros y saludables para estimular la actividad física.
3. Implementar políticas para el control del tabaquismo, estimular la alimentación saludable y la actividad física, reducir el consumo de sal y el consumo perjudicial de alcohol, control del peso, con el objetivo de reducir la incidencia de enfermedades cardio y cerebrovasculares.
4. Establecer estrategias de detección de factores de riesgo tratables como hipertensión, fibrilación atrial, diabetes y dislipidemias.
5. Promover la atención buscando el control de factores de riesgo tratables.
6. Organizar la atención prehospitalaria, priorizando el paciente con ACV.
7. Priorizar la estructuración de los Centros de ACV.
  - Organizar las Unidades de ACV con área física definida y equipo multidisciplinario capacitado.
  - Viabilizar los tratamientos de fase aguda basados en evidencia.
  - Viabilizar exámenes para la investigación etiológica mínima.
  - Promover el alta hospitalaria con prescripción de la prevención secundaria al ACV.
  - Estimular el uso de la telemedicina en los hospitales sin acceso a especialista en tiempo integral, para la orientación del tratamiento agudo.
8. Ampliar el acceso a rehabilitación hospitalaria y después del alta hospitalaria.
9. Capacitar profesionales de la salud involucrados en la atención al ACV.
10. Establecer la monitorización nacional de la prevalencia de los principales factores de riesgo en el país y de los indicadores asistenciales de atención al ACV.
11. Establecer directrices Nacionales y regionales basadas en evidencia científica, para el tratamiento estandarizado del ACV con actualizaciones periódicas.
12. Priorizar la estructuración de redes asistenciales integradas de cuidados continuados al paciente con ACV o con factores de riesgo para el ACV, que engloben todos los niveles de atención, estableciendo una Línea de Cuidado.
13. Destinar recursos humanos y financieros para la estructuración de la Línea de Cuidado de ACV.
14. Establecer planes nacionales de atención al ACV.
15. Promover el intercambio de experiencias entre los países, para perfeccionar la atención al ACV.
16. Establecer investigación en ACV basada en las prioridades y realidades de cada país.

## Panel 2: Declaration of Gramado

We, representatives of the 13 countries and representatives of their Ministries that participated in the 1st Latin-American Ministerial Stroke Meeting in Gramado, Brazil, on Aug 2, 2018:

- acknowledging that cerebrovascular diseases, including stroke, are among the main causes of death in the adult population of Latin America, and that stroke is preventable and treatable through evidence-based and cost-effective strategies;
- highlighting that the cooperation among Latin American countries for tackling stroke is included in the implementation framework of the Sustainable Development Goals of the UN 2030 agenda, which proposes collaboration for reducing premature death by noncommunicable diseases by means of prevention and treatment, and for promoting mental health and wellbeing until 2030;
- and considering the WHO Global Action Plan for Prevention and Control of Noncommunicable Diseases 2013–2020 that aims to reduce in 25% the premature death by chronic diseases until 2025; decided to unite our efforts to promote the development and implementation of effective, integrated, sustainable, and evidence-based public policies for the prevention and treatment of stroke and its risk factors in Latin America,

National plan for stroke		Acute stroke care		Rehabilitation		Access to stroke care and rehabilitation*	
		Stroke centres and units	Thrombolysis	Thrombectomy	In-hospital		After discharge
Argentina	No	1 public and 5 private hospitals; no stroke units	5 private hospitals	5 private hospitals	No data	No data	Poor
Bolivia	No	Few private hospitals (no quantitative data available); no stroke units	Private hospitals	Few private hospitals (no quantitative data available)	No data	No data	Poor
Brazil	Yes	156 hospitals, 78 are private; 74 with stroke units	78 public and 78 private hospitals; in 24 hospitals thrombolysis is provided by the use of telemedicine	2 public and 64 private hospitals	Widely available in stroke units	Yes	Intermediate access to acute care; quick access to rehabilitation after discharge is limited
Chile	Yes	54 hospitals (20 public and 34 private); all with stroke units	20 public and 34 private hospitals, including 6 (private) that provide telemedicine	6 public and 6 private hospitals	Widely available in stroke units	Yes	Good
Colombia	No	48 hospitals (including 14 public hospitals); no stroke units	14 public and 34 private hospitals	3 private hospitals	Yes	No data	Intermediate access to acute care; no data about rehabilitation
Costa Rica	No	4 public and 1 private hospitals; all with stroke units	4 public and 1 private hospitals	2 public hospitals	Yes	Yes	Intermediate access to acute care; quick access to rehabilitation after discharge is limited
Ecuador	No	1 public hospital with a stroke unit	1 public hospital	Not available	Only 1 public hospital	No data	Poor
Guatemala	No	1 private hospital with a stroke unit	1 private hospital	1 private hospital	No data	No data	Poor
Mexico	No	2 public and 4 private hospitals; 5 hospitals with stroke units	4 private and 1 public hospitals	4 private hospitals	No data	No data	Poor
Panama	No	8 public and 5 private hospitals	8 public and 5 private hospitals	1 public and 4 private hospitals	Yes	Yes	Intermediate access to acute care; quick access to rehabilitation after discharge is limited
Paraguay	No	2 public hospitals with stroke units; 6 private hospitals without stroke units	2 public and 6 private hospitals	Not available	Yes	No data	Poor access to acute care; no data about rehabilitation after discharge
Peru	No	4 public hospitals with one stroke unit, 1 private hospital without stroke unit	4 public and 1 private hospitals	Not available	No data	No data	Poor access to acute care; no data about rehabilitation after discharge
Uruguay	No	18 hospitals (16 private without stroke units; 1 public and 1 private hospitals with stroke units)	1 public 17 private hospitals	1 private hospital	No data	No data	Poor access to acute care; no data about rehabilitation after discharge

Data based on personal communication with the Ministries and experts in the countries listed in the table. Intermediate access to acute care defined as within 1-2 h and quick access to rehabilitation defined as within 7 days after hospital discharge. \* Poor access: only few (one or two) stroke centres in the country; intermediate access: number of stroke centres is not sufficient for the number of inhabitants, or the overall number of centres is sufficient but the country has some areas without coverage; good access: sufficient number of centres for the number of inhabitants and the centres are well distributed across the country.

# Conclusion

- Major differences in stroke care in Latin American countries
- Limited funding by government
- Several cost-effective strategies implemented (only in 2 countries in country level)
- A lot of local initiatives
- Stroke Awareness campaigns increasing in the region
- Several countries without a pre-hospital organization for stroke – it is a fundamental part of stroke care and still a huge gap in several countries

# To Ask a Question

The screenshot shows a webinar interface. The main slide features the American Stroke Association and SVIN logos at the top. The title of the slide is "International Perspectives on Stroke Triage, Diagnosis and Treatment". On the right side, there is a "Questions" sidebar. The sidebar contains a message from the webinar staff: "Webinar staff to everyone. The test webinar will begin soon." Below the message is a text input field with the placeholder text "Ask the staff a question" and a blue "Send" button. A yellow circle highlights the input field and the "Send" button. The sidebar also includes icons for a microphone, a hand, a question mark, and a speech bubble, along with an "Exit" button at the bottom.
